

AURORA

High-Fidelity UI / UX Render Pack

Visual north star for the UI-01C refinement pass

Modern macOS creative workstation + professional lighting-control DNA + modular stage workflow.

Use these renders for visual hierarchy, density, component character, and product identity. Backend contracts remain authoritative.

01 - Core Application Vision

Primary high-fidelity concept: Build Mode, Perform Mode, and MIDI Mapping Settings. This establishes Aurora's overall product character and the relationship between creative programming and stage operation.

Reference render - visual intent, not pixel-perfect implementation or authoritative sample data.

02 - Complete Application Vision

Extended reference board showing how the same design language can scale into Patch, Effects, Web Remote, and Art-Net/sACN output configuration. These later surfaces are visual references, not instructions to implement later roadmap phases now.

Reference render - visual intent, not pixel-perfect implementation or authoritative sample data.

03 - UI/UX Reference Renders

Focused design board for Build Mode, Perform Mode, MIDI mappings, detailed Programmer controls, palettes/presets, and the web/iPad performance interface. Use this as the clearest component-level visual target for UI-01C.

Reference render - visual intent, not pixel-perfect implementation or authoritative sample data.
